

# Dental Bridges

**Dental bridges look, feel and function like natural teeth; they don't require removal for cleaning; and they cost less than dental implants.**

## About

Dental bridges are used to replace missing teeth and fill a space where one or more teeth have been lost. They are created by connecting two or more dental crowns together. Unlike dentures, a bridge is bonded or cemented into place.

## Caring For Your Dental Bridge

Make sure you brush twice a day with a soft-bristled toothbrush and don't forget to floss. Also avoid hard, sticky snacks.

## Procedure

1. On your first visit, we prepare your teeth on either side of the gap as the bridge will be attached to these teeth.
2. We then take an impression of your teeth and while your bridge is being developed, a temporary bridge will be placed to protect your exposed teeth.
3. The bridge will be fitted on your second visit. Adjustments will be made before the bridge is bonded with a high-tech cement.

## Cost | From \$1,800

The total cost of treatment can be affected by several factors. Our team will advise you of these during your consultation.
