

Forehead Wrinkles

The forehead is one of the first places to age in the face and cosmetic treatments to this area are among the most popular requested.

About

The reason our forehead wrinkles is because a muscle called the frontalis muscle contracts every time we lift our eyebrows or express different emotions. The forehead also loses volume with ageing which makes it appear flatter and the bony outline of the skull becomes more evident.

Cost | From \$275 Per Area

Several factors can vary and increase the cost of treatment.

Treatment

Treating forehead wrinkles is achieved with a series of tiny injections with a facial filler also known as dermal fillers. These injections reduce the contraction of the frontalis muscle by preventing the transmission of the nerve signal to the muscle, as well as adding volume to the facial areas. Taller foreheads may require more injection points to attain a more even result.

The injections are temporary, lasting from 2 to 4 months and the treatment begins to take noticeable affect after about 4 days. Often patients request an eyebrow lift in addition to a reduction of forehead lines as it can further reduce the impact of the frontalis muscle contracting. This is achieved by treating the central parts of the forehead only, and leaving the areas above the tail of the eyebrows.
